

## Key tips when applying the G1 Grazers product

(effective against Rabbits, Pigeons, Deer and Geese)

1. Outwit the pest, get ahead and **apply prior to significant crop grazing** (even early crop growth stage).
2. Consider the **factors effecting best outcome**, so vary the application amount and timing according to:
  - a) **Crop growth rates** (new growth appears has diminished coverage by Grazers so needs reapplying).
  - b) **Pest pressure** (the higher the number the greater the application amount or frequency)
  - c) **Weather conditions** (re-application may be required after persistent or heavy rain)
3. Maximise product efficacy by **adding an extra adjuvant** (eg a non-ionic wetter such as Activator 90).
4. If necessary, **re-apply to accumulate product** on plant, eg brassica in plugs prior to transplanting.
5. **Tank mix with pesticides** (see new recommendations), when possible, to improve cost efficiency

With the above advice, **be proactive**, as opposed to reactive to your pest grazing problem.

**Grazers will now work best for you, to get greater returns.**
